MUCH MORE FUN...

Once upon a time there was a model...

(Guthrie et al., 2013)

Nice paper, good results, but...

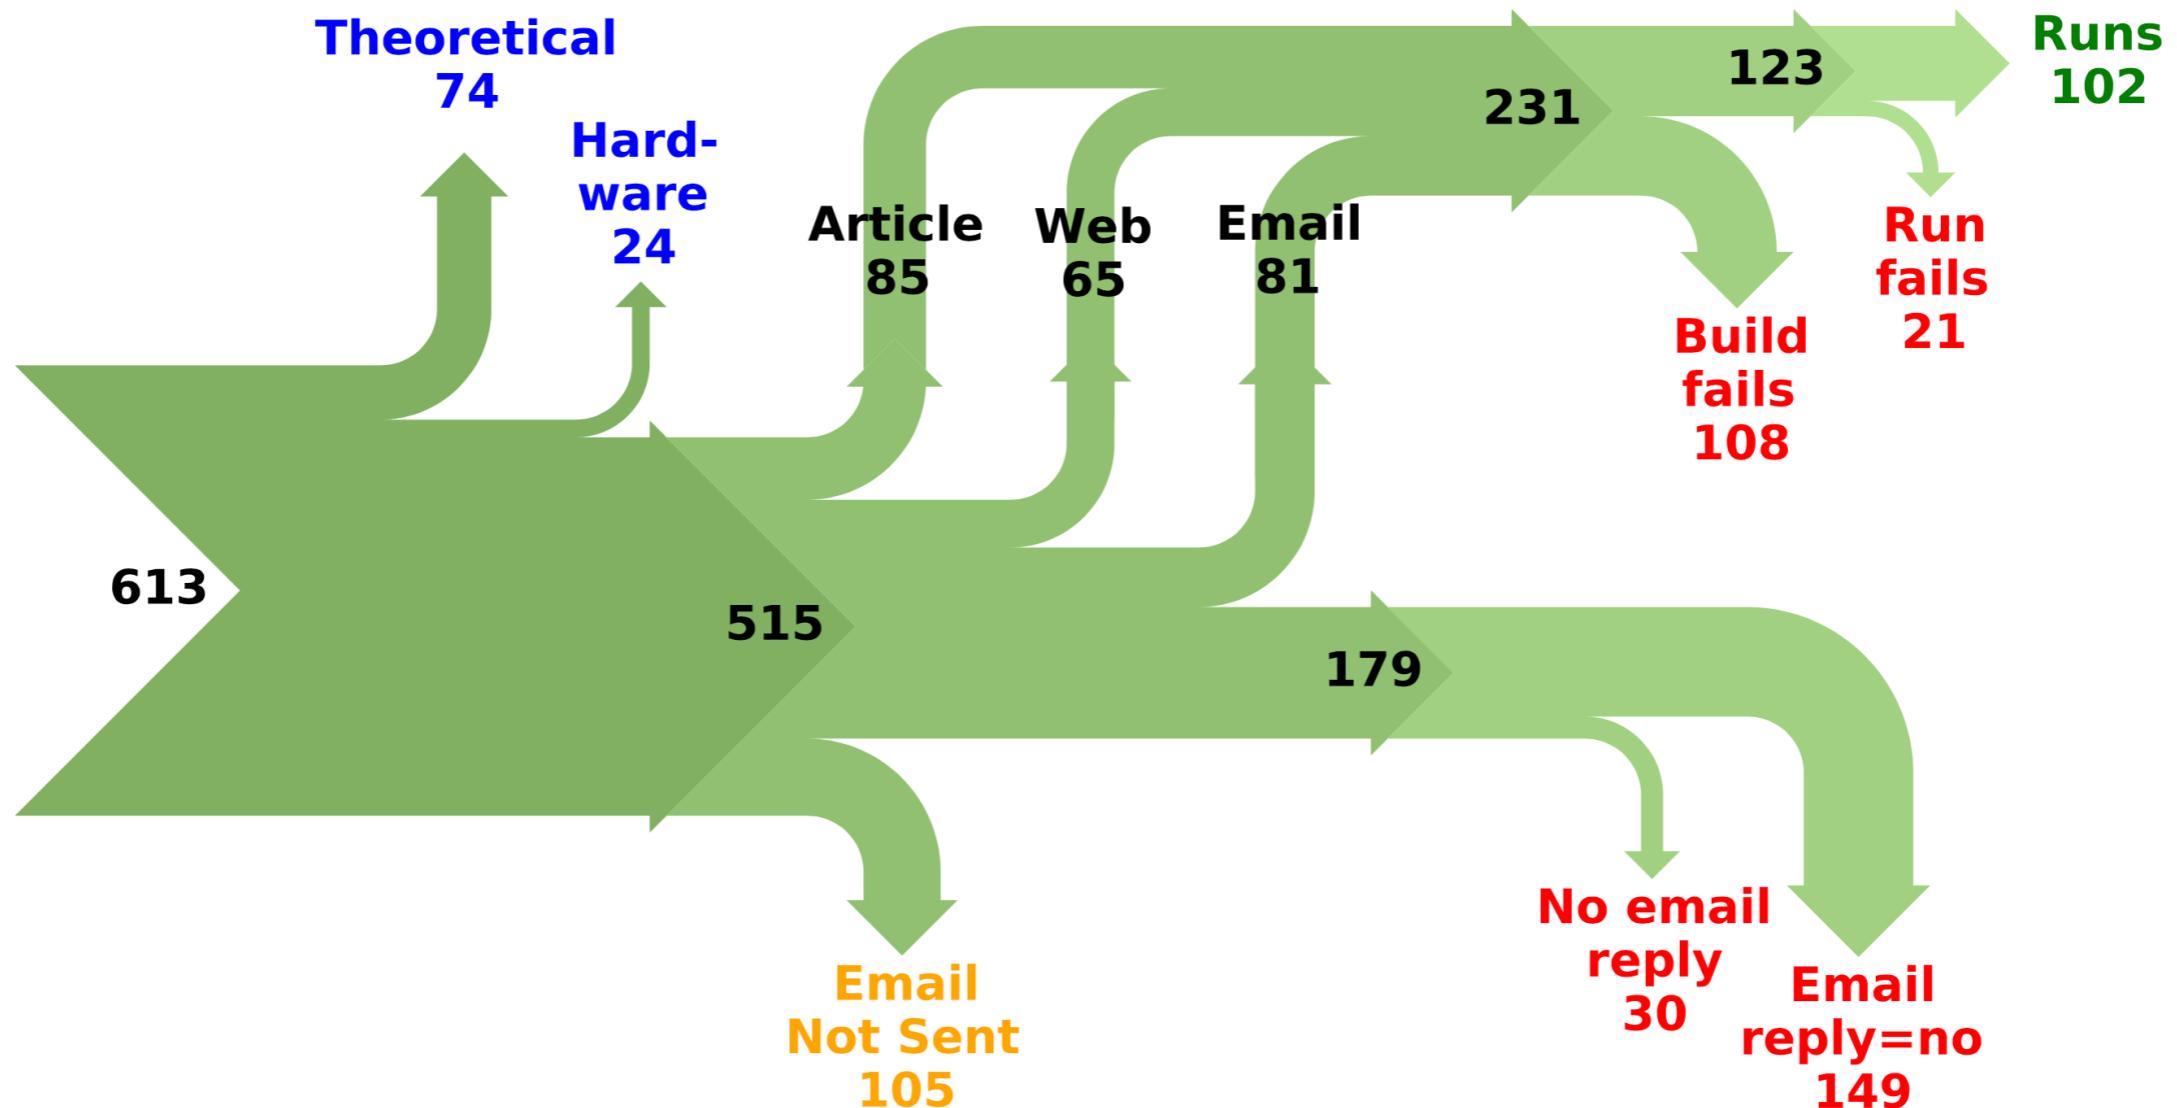

- No public repository
- No easy access
- No version control
- Model description included ambiguous information
- Sources were mixing actual computation and GUI code
- Model was split into a hundred files
- Main file was 6,000 lines long

Model was not reproducible.

Did you say reproducible science ?

(Colbert et al., 2014)

Measuring Reproducibility in Computer Systems Research

Three months of hard work for a 200 lines script...

(Topalidou et al., 2015)

Three months of hard work:

- Use of the Python language and numerical libraries
- Use of the DANA library for intuitive description
- Use of the IPython notebook for interactive sessions

Source is now a single file of ~200 readable lines.

Without this replication effort, model would have been dead and **forgotten** by the community.

What is replication ?

octodex.github.com

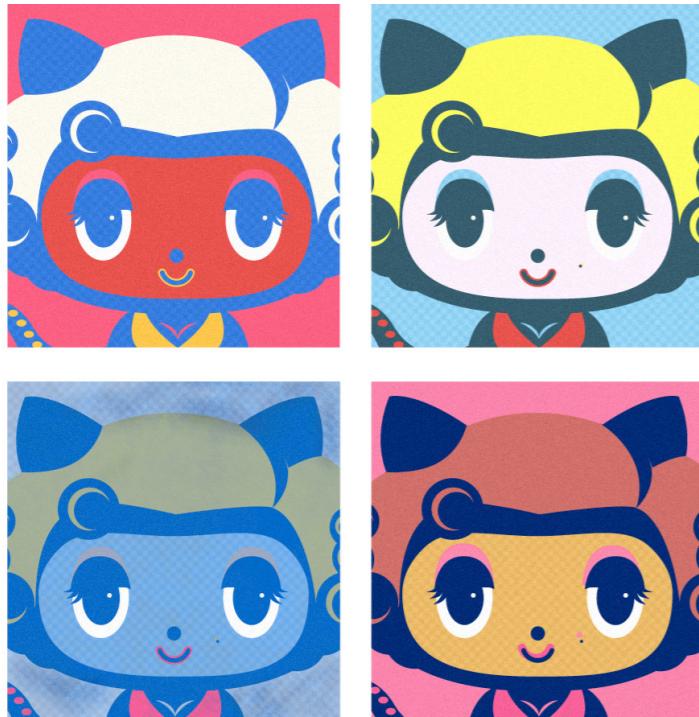

Bob reads Alice's paper, takes note of all model properties and then implements the model himself using a method of his choice.

Bob confirms Alice's result by obtaining qualitatively the same results.

Alice's model has been replicated.

Who wants to replicate?

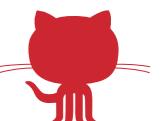

octodex.github.com

During the course of a PhD, it is often the case that a student will try to replicate results from the literature, possibly interacting with the original authors.

Such replication generally lives inside the hard-drive of the computer's student while it would be actually useful for the whole scientific community.

What do we do then ? **Let's review it & publish it !**

Can we make such effort sustainable ?

Yes we can !™

ReScience is a peer-reviewed journal that target **any** computational research and encourage the explicit replication of already published research promoting new and open-source implementations.

ReScience lives on github where each new implementation is made available together with explanations (article)

Why GitHub ?

GitHub offers a web-based git repository hosting service with great specific features (issue, pull request, etc).

- Version control
- Public repositories
- Transparency and verifiability
- Easy exploration of new ideas

A kind of modern lab notebook for the computer scientist.

How to submit ?

1. Fork the [ReScience-Submission](#) repository
2. Write your code, data and article
3. Submit a pull request
4. Address reviewer's comments and questions
5. Get published and get a DOI (through Zenodo)

Actual submission

(Topalidou and Rougier, 2015)

Authors: Meropi Topalidou & Nicolas Rougier

Editor: Tiziano Zito

Reviewers: Mehdi Khamassi & Benoît Girard

The screenshot shows a GitHub pull request page for the repository 'ReScience-submission'. The title of the pull request is 'Review Request : M. Topalidou, N. Rougier #3'. The status is 'Open' and it shows 'rougier' wants to merge 10 commits from 'rougier:topalidou-rougier' into 'ReScience:master'. The conversation has 10 messages, there are 10 commits, and 17 files changed. The review score is +1,396 -118. The author's comment from June 9th reads: 'Dear @ReScience/editors, I request a review for the reproduction of the following paper: • Interaction between cognitive and motor cortico-basal ganglia loops during decision making: a computational study, M. Guthrie, A. Leblois, A. Garenne, and T. Boraud, Journal of Neurophysiology, 109, 2013.' On the right side, there are sections for Labels (Life Science, Review request), Milestone (No milestone), and Assignee (otizonaizit). A GitHub logo is visible in the bottom right corner.

[Re] Interaction between cognitive and motor cortico-basal ganglia loops during decision making: a computational study

A reference implementation of

→ *Interaction between cognitive and motor cortico-basal ganglia loops during decision making: a computational study*, M. Guthrie, A. Leblois, A. Garenne, and T. Boraud, *Journal of Neurophysiology*, 109, 2013.

Introduction

We propose a reference implementation of [1] that introduces an action selection mechanism in cortico-basal ganglia loops based on a competition between the positive feedback, direct pathway through the striatum and the negative feedback, hyperdirect pathway through the subthalamic nucleus. The original implementation was made in Delphi (Object Pascal) whose sources are available on request to any of the author of the original article. We have used these sources to disambiguate ambiguous and missing information in the original article. The reference implementation we propose has been coded in Python for ease of reading and Cython for performances because the main result includes a batch of 250 experiments over 120 trials that would be too slow for regular Python scripts.

Methods

We used the description of the model in the original article as well as the sources of the model (requested from author) that are made of a hundred files and 6,000 lines of Delphi for the main source. We have been unable to compile this original implementation but we were able to run the provided Windows executable. We found some factual errors in the original article that have been corrected in this implementation. The initialization of weights are defined in two different parts of the paper. First on page 3030 (second column) “Weights were initialized to a Gaussian distribution with a mean of 0.5 and a SD of 0.005 at the start of each simulation...”, then on page 3031 in the caption of figure 4, “All synaptic weights were initialized to 0.5”. It happened that both definitions are right but do not address the same projections. Cortico-striatal synaptic weights use Gaussian distribution while all other weights are set to 0.5. Furthermore, the Boltzmann equation given in the original paper uses a . instead of + between first term and second term.

One notable modification in our implementation is the reinforcement learning rule that has been greatly simplified. Original authors have been using quite a complex algorithm for ensuring that “*corticostriatal weights are bounded by a sigmoidal transfer function to represent physical constraints on synaptic growth with an absolute maximum of 0.75 and an absolute minimum of 0.25.*” This algorithm is not described in the article, but from sources, it appears that it is based on the estimation of the weight gradient along the sigmoid. We use instead an Oja-like rule given in the *Synapse* table.

We provide below the formal description of the model according to the proposition of Nordlie et al. [2] for reproducible descriptions of neuronal network models.

Table 1: Model description following [2] prescription.

Table	Description
Populations	Cortex (motor, associative & cognitive), Striatum (motor, associative & cognitive), GPi (motor & cognitive), STN (motor & cognitive), Thalamus (motor & cognitive)
Topology	–
Connectivity	One to one, one to many (divergent), many to one (convergent)
Neuron model	Dynamic rate model
Channel model	–
Synapse model	Linear synapse
Plasticity	Reinforcement learning rule
Input	External current in cortical areas (motor, associative & cognitive)
Recordings	Firing rate & performances

Table 2: Populations

Name	Elements	Size	Threshold	Noise	Initial state	τ
Cortex motor	Linear neuron	1 × 4	-3	1.0%	0.0	10
Cortex cognitive	Linear neuron	4 × 1	-3	1.0%	0.0	10
Cortex associative	Linear neuron	4 × 4	-3	1.0%	0.0	10
Striatum motor	Sigmoidal neuron	1 × 4	0	0.1%	0.0	10
Striatum cognitive	Sigmoidal neuron	4 × 1	0	0.1%	0.0	10
Striatum associative	Sigmoidal neuron	4 × 4	0	0.1%	0.0	10
GPi motor	Linear neuron	1 × 4	+10	3.0%	0.0	10
GPi cognitive	Linear neuron	4 × 1	+10	3.0%	0.0	10
STN motor	Linear neuron	1 × 4	-10	0.1%	0.0	10
STN cognitive	Linear neuron	4 × 1	-10	0.1%	0.0	10
Thalamus motor	Linear neuron	1 × 4	-40	0.1%	0.0	10
Thalamus cognitive	Linear neuron	4 × 1	-40	0.1%	0.0	10
Values (V_i)	Scalar	4	–	–	0.5	–

Table 3: Connectivity

Source	Target	Pattern	Weight	Gain	Plastic
Cortex motor	Thalamus motor	(1, i) → (1, i)	1.0	0.4	No
Cortex cognitive	Thalamus cognitive	(i , 1) → (i , 1)	1.0	0.4	No

What if I cannot replicate a result?

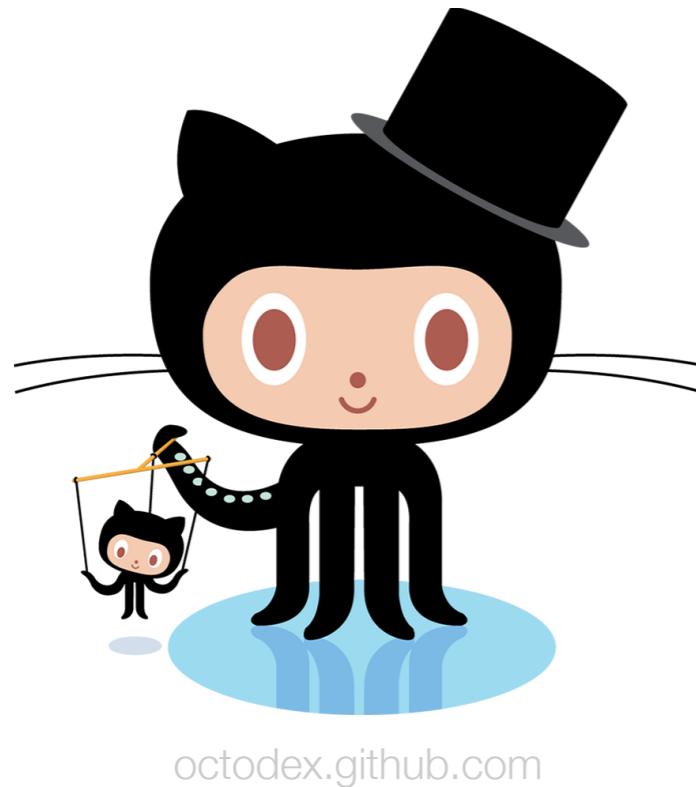

Some research may not be replicable. Before declaring a research result non-replicable, we require extra caution to be taken.

In addition to scrutiny of your submission by reviewers and editors, we will contact the authors of the original research, and issue a challenge to the ReScience community to spot and report (using the issue tracker) errors in your implementation.

If no errors are found, your work will be accepted and the original research will be declared non-replicable.

What about replication of my own work?

octodex.github.com

No. Mistakes in the implementation of research questions and methods are often due to biases authors invariably have, consciously or not.

One's biases will inevitably carry over to how one approaches a replication.

Perhaps even more importantly, we aim at the cross-fertilization of research and trying to replicate the work of one's peers might pave the way for a future collaboration, or may give rise to new ideas as a result of the replication effort.

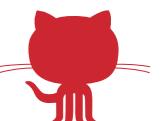

You can help!

octodex.github.com

- Become a reviewer
- Submit paper for the work you've already replicated
- Spread the word about ReScience in your community
- Star the project on GitHub
- Help improving the journal
- Open an issue if you have any unanswered question.
